

## NAME

INTRO – Introduction to the Shore Threads Package

## SYNOPSIS

The Shore Thread Package (sthread) provides C++ style light-weight processes. It provides the following facilities (further described by documents referenced in the See Also section):

Threads

Mutexes

Conditional variables

Event semaphores

Asynchronous disk I/O

Asynchronous file I/O handlers

## DESCRIPTION

The thread mechanism allows several threads of control to share the same address space. Each thread is represented by an instance of **sthread\_t** class. Once created, a thread is an independent entity with its own stack.

In a C++ program, the sthread initialization code is built into the library such it will execute before the **main()** function begins. The initialization code is responsible for spawning a **main\_thread**, such that, when the initialization function returns, it returns in the context of the **main\_thread**. This ensures that the program executes in a threaded environment from the beginning.

## ENVIRONMENT

Sthread currently runs on the following processors/platforms:

DecStation 3100 and 5000 series (MIPS, Ultrix)

Intel Paragon (i860, OSF/1)

HP 700 series (HP-PA, HP-UX 8.0 and 9.0)

Sparcstation (SunOS 4.3.1, Solaris)

x86 (Linux, Solaris)

Silicon Graphics (Irix)

## ERRORS

See **errors(sthread)**

## VERSION

This manual page applies to Version 2.0 of the Shore Storage Manager.

## SPONSORSHIP

The Shore project is sponsored by the Advanced Research Project Agency, ARPA order number 018 (formerly 8230), monitored by the U.S. Army Research Laboratory under contract DAAB07-91-C-Q518. Further funding for this work was provided by DARPA through Rome Research Laboratory Contract No. F30602-97-2-0247.
